Get calls

Get Agent Calls

This endpoint retrieves a list of agent calls with optional filtering and pagination. Use this endpoint to query call records for a specific agent and analyze call history, performance, and outcomes.

Query Parameters

- `agent_id` (UUID, required): The ID of the agent to retrieve calls for
- `in_progress_only` (boolean, optional): Filter to only return calls that are currently in progress
- `id` (string, optional): Filter by specific call ID
- `phone_number` (string, optional): Filter by customer phone number. Matches a substring of the customer’s phone number after stripping all non-digit characters from both sides, so `(555) 123-4567` , `5551234567` , and `+1 555 123 4567` all match the stored E.164 form `+15551234567` .
- `status` (string, optional): Filter by call status (e.g., “completed”, “failed”, “in_progress”)
- `start_date` (datetime, optional): Filter calls created after this date (ISO8601 format)
- `end_date` (datetime, optional): Filter calls created before this date (ISO8601 format)
- `tag` (string, optional): Filter by call tag
- `order_by` (string, optional): Order results by field. Options: “created_at”, “ended_at” (default: “created_at”)
- `offset` (integer, optional): Number of records to skip for pagination (default: 0)
- `limit` (integer, optional): Maximum number of records to return (default: 100)
- `snapshot_ids` (array of UUIDs, optional): Filter by specific agent snapshot IDs
- `select` (array of strings, optional): Specify which fields to include in the response
- `results` (string, optional): Filter by call results

Response

On success, the endpoint returns:

- Status code: `200 OK`
- Body: JSON object containing:
 - `calls` : Array of call records matching the specified criteria
 - `total_count` : Total number of calls matching the filters (useful for pagination)

Pagination

Use the `offset` and `limit` parameters to paginate through large result sets:

- `offset` : Skip this many records
- `limit` : Return at most this many records
- `total_count` : Use this to calculate total pages

Filtering by Date Range

When filtering by date range, both `start_date` and `end_date` accept ISO8601 formatted datetime strings:

- `start_date` : Include calls created on or after this date
- `end_date` : Include calls created on or before this date

Common Errors

- `422 Unprocessable Entity` : If query parameters contain invalid data
- `403 Forbidden` : If you lack permissions to access the requested call data
- `404 Not Found` : If the specified agent doesn't exist

Example

```
curl -X GET "https://api.leaping.ai/v1/calls/?agent_id=550e8400-e29b-41d4-a716-446655440000&status=completed" \
-H "Authorization: Bearer YOUR_TOKEN"
```

Usage with Call Analytics

This endpoint is essential for building call analytics dashboards and monitoring agent performance. Combine it with date range filtering to analyze call volume trends, success rates, and other key metrics over time.
