Outbound

Schedule outbound calls

Uploading leads

The Leaping AI system can be used to schedule outbound calls. To do this, simply upload a list of numbers in a CSV. Note that the phone numbers need to be in column 1 of the CSV. Also they need to follow this format: ‘+(country code)(number)’, e.g., ‘+14157916601’.

It is also possible to “inject” dynamic information, such as name of the person, address or other information.

Step 1: Create fields in the agent builder (studio) that contain the variable information. Best example is “name” to hold the customer name.

Step 2: Reference those fields in the prompts (stage messages) using double curly brackets. Example: “Greet the customer as {{name}}”.

Step 3: After you have uploaded your CSV, you can “map” certain columns of the CSV to their respective fields.

Scheduling calls

All the phone numbers uploaded will appear in the **Staged** section. Some or all of them can be selected to be “scheduled”. To schedule a call, you have to configure a time period in which the calls will happen. The scheduler will then equally distribute the calls in the specified time period. We recommend specifying a large enough time window (at most 500 calls per hour).

When scheduling, you can choose a single caller number or toggle on **Use multiple phone numbers** to select several. If multiple numbers are selected, calls are distributed across them at random.

Note: currently only 500 calls maximum can be scheduled at once. Thus, if you have 1,000 leads, you have to schedule 500 calls at a time. We are working to remove the limitation.

Daily call limit

Each agent has a **Max Daily Outbound Calls** setting (in the agent’s Details tab, defaults to 3). This is the maximum number of times the same customer phone number will be called in one day. Once a phone reaches the limit, further calls to it that day are filtered out. The day is the customer’s local calendar day, not UTC, so the cap rolls over at the customer’s local midnight.

If a call is blocked by the cap but your schedule covers multiple days, it’s automatically retried on the next day within your scheduled window. Calls that can’t be retried (no remaining days in the schedule, or no schedule at all) show as **Failed** in the calls table.

Before scheduling, you can use the **preview** feature (available in the API) to see how many calls would be filtered without actually scheduling anything.

Do Not Call filtering

Numbers on your group’s [Do Not Call list](#) are automatically blocked from being staged and filtered out at scheduling time. When uploading a CSV or scheduling calls, you will see a warning showing how many numbers were filtered by the DNC list, displayed separately from daily limit filtering.

After calls are placed

After all the calls are placed, they will either appear in the **Done** or **Failed** section. All calls in the **Failed** section either were not placed due to technical reasons or landed in voicemail. One can “re-stage” all the failed calls. Those calls will appear again in the **Staged** section.
