

Essentials

Phone numbers (Telephony)

Learn how to view, purchase, import and manage your phone numbers inside Leaping.

Telephony Overview

The **Telephony** section lets you manage your phone numbers.

Open **Dashboard** → **Telephony** to see a list of all numbers you own or have imported.

Phone numbers are shared **per group**. Only group *admins* can purchase or delete numbers that live in Leaping's Twilio account.

Phone-number table

Column	What it tells you
Phone number	The E.164 formatted number (<code>+1 415...</code>). A small “External” badge means it lives in <i>your</i> Twilio account, not Leaping’s.
Label	A nickname you can click to edit inline (e.g. <i>“Support Line FR”</i>).
Region	The Leaping deployment region (e.g. <i>eastus, sweden</i>) that routes calls for this number.
Status	Available – not deployed yet Deployed – currently deployed to an agent snapshot
Deployed	The snapshot label that answers this number, or “–”.
Added at	Date the number was linked to your workspace.
Delete	Trash icon → deletion flow (with dependency checks).

Adding a phone number

Click **“Add Phone Number”** to open a two-option picker:

- Purchase new number** (Leaping buys & hosts it)
- Import existing number** (you keep it in your own Twilio account)

Purchasing a new number

- Choose **Purchase new number**.
- In the modal:

Field	Required	Notes
Country	✓	Determines available inventory and compliance rules.
Group	✓	Number ownership. You must be an <i>admin</i> of that group.

- Click **Purchase Phone Number**.
Leaping contacts Twilio's API and assigns a fresh number to your workspace.
You'll see a success toast with the exact number purchased.

Many countries (e.g.  France,  Germany,  South Korea) require **regulatory bundles** before a number can be used. If you need numbers in a regulated market, reach out to us so we can register the necessary documentation with Twilio on your behalf.

Importing a number from your own Twilio account

Choose **Import existing number** and provide:

Field	Required	Why we need it
Phone number SID	✓	Identifier starting with <code>PN...</code>
Label	–	Friendly display name
Region	✓	Leaping deployment region that will handle calls
Group	–	Ownership group (optional)
Account SID + Auth Token	✓	Credentials of the external Twilio account

Press **Import Phone Number** – the number appears instantly with an “External” badge.
You’re still billed by Twilio directly; Leaping only references the number.

Managing numbers

- Edit label** – click the label cell, type a new name, press *Enter* or click elsewhere.
- Deploy / change agent** – open *Agent Studio* → *Phone deploy*, select the number and snapshot.
- Delete** – click the trash icon, follow the safety steps (number must be undeployed first).

When you delete a phone number, Leaping first checks that it's **not currently deployed** to an agent and has **no scheduled outbound calls**. If dependencies exist, you'll see a warning with the option to force-delete, which will also remove any associated deployments and scheduled calls.

Connecting Calls to Our Platform

You can connect calls to our platform in two main ways:

- Standard Telephony Forwarding**
- Direct SIP Integration (INVITE or REFER)**

Option 1: Standard Telephony Forwarding

Forward calls from your telephony system to the phone number assigned in our platform.

How It Works

- Configure your telephony system to forward calls to the number assigned in our system.
- The agent answers these calls as a regular PSTN call.

Restrictions

- No SIP Features** – Works like a normal phone call, without SIP control.
- Carrier Costs** – Calls traverse the PSTN, which may introduce additional per-minute charges.
- Less Efficient** – Adds a PSTN hop, which can increase latency compared to SIP.
- Limited Flexibility** – No direct call handovers (e.g., REFER), no custom headers, no direct SIP addressing.

This is the **simplest integration** method but not the most flexible.

Option 2: SIP Integration

SIP lets you bypass the PSTN entirely and connect directly to our platform.
This reduces latency, improves reliability, and gives you more control over call flows.

SIP Advantages

- No PSTN Hop** – Calls route directly via SIP, avoiding unnecessary network transitions.
- Lower Latency** – Faster call setup and media paths.
- Scalable** – Easily handles large call volumes.
- Flexible Call Control** – Use SIP REFER for seamless handovers.
- Secure** – TLS transport available for encrypted signaling.
- Custom Identifiers** – Add custom SIP headers to track and match calls with API sessions.
- Standards-Based** – Works with most SIP trunks, SBCs, and PBX systems.

SIP URI

All SIP calls (INVITE or REFER) use the same addressing format:
<your_agent's_phone_number>@<our_domain>

Deployment Domains

- Europe (UDP):** `leaping-eu-udp.sip.twilio.com`
- Europe (TLS):** `leaping-eu-tls.sip.twilio.com`
- US (UDP):** `leaping-us-udp.sip.twilio.com`
- US (TLS):** `leaping-us-tls.sip.twilio.com`

Choose the domain closest to your location for lower latency. Use **TLS (Port 5061)** when full encryption (including signaling, headers) is required, otherwise **UDP (Port 5060)** is sufficient.

Example: sip:+4915123456789@leaping-eu-tls.sip.twilio.com

SIP Transport and Ports

- UDP** → Port `5060`
- TLS** → Port `5061`

SIP INVITE

- Send a direct INVITE to the SIP URI of the deployed agent.
- Suitable for SIP trunks, SBCs, or softphones that originate calls directly.

SIP REFER (Recommended)

- Transfer an active call to the agent using SIP REFER.
- Ideal for PBX/IVR scenarios where you want to hand over the caller mid-flow.
- Establishes a **direct media stream** with our platform, keeping the setup clean.
- Recommended for enterprise and contact-center deployments.

Custom SIP Headers

When using SIP, you can pass along additional headers to identify or tag calls.
This is useful for matching a SIP call to an API request, CRM record, or internal system.

Example:
INVITE sip:+4915123456789@leaping-eu-tls.sip.twilio.com SIP/2.0 X-Call-Identifier: abc123-session X-Customer-ID: 98765

These headers are forwarded into our platform and can be used to correlate voice interactions with external systems or reroute calls in your own infrastructure.

Setup Steps

- Deploy your agent** to a phone number in our platform.
- Choose your connection method:**
 - Standard telephony forwarding, or
 - SIP integration (INVITE or REFER, with REFER recommended).
- Configure your telephony system** with the SIP URI, domain, and (optionally) custom headers.
- Test the call** to confirm connectivity.

FAQ

What happens to call history after deleting a number?

Call logs remain available for analytics, but the number itself disappears from every deployment.
